## **DETAILED ACTION**

## Claim Rejections - 35 USC § 102

1. The rejection of claims 1-2, and 5-6 made in paper no. 9 is repeated.

Applicant has traversed the above rejection by arguing that Hokodate et al fails to disclose a temperature compensation unit which adjusts the focal-point position of the light beam by directly varying a focusing effect of a correction lens on the light beam from the light source by a controlled amount of movement of the correction lens along it's optical axis that corresponds to the temperature change. This argument is not found persuasive because Hokodate et al, in Fig. 44, clearly discloses an optical scanning device which comprises a light source for emitting a light beam L; a scanning optical unit including scanning mirrors (3,4) for deflecting the light beam emitted from the source, and a converging lens (20) for focusing the deflected light beam on a scanned surface (w); a temperature detection unit (26); and a temperature compensation unit including control circuit (124) adjusting the focal-point position of the light beam by directly varying a focusing effect of a correction lens (121) on the light beam from the light source by a controlled amount of movement of the correction lens along it's optical axis that corresponds to the temperature change.

In re claim 5 all the claimed method steps are inherently disclosed because the optical scanning device of the applied prior art has sufficient structure to carry out the method steps.

In re claim 6 the preamble has not been given any patentable weight.

Application/Control Number: 09/716,949

Art Unit: 2872

- 2. The indicated allowability of claims 3-4 is withdrawn in light of the following rejection.

  The examiner apologizes for any inconvenience that might have caused.
- 3. Claims 3 and 4 are rejected under 35 U.S.C. 102(e) as being anticipated by Hokodate et al.

Hokodate et al, in Fig. 44, clearly discloses an optical scanning device which comprises a light source for emitting a light beam L; a scanning optical unit including scanning mirrors (3,4) for deflecting the light beam emitted from the source, and a converging lens (20) for focusing the deflected light beam on a scanned surface (w); a temperature detection unit (26); and a temperature compensation unit including control circuit (124) adjusting the focal-point position of the light beam by directly varying a focusing effect of a correction lens (121) on the light beam from the light source by a controlled amount of movement of the correction lens along it's optical axis that corresponds to the temperature change.

In re claim 3 the temperature compensation unit (124) inherently included a memory that stores a table defining a relationship between the temperature change and a corresponding focal-point deviation of the light beam on the scanned surface because the memory is a necessity so that the control circuit (124) outputs an appropriate instruction for a lens position according to the temperature of the converging lens (20) detected by the temperature sensor (26) for adjustment (column 32, lines 39-44); also see column 18, lines 5-13).

In re claim 4 an integrated circuit board is inherently provided because it is a necessity for mounting the electrical components of the temperature detection unit.
